Deliverable C2.D1.A

Report on the completed technical arrangements/infrastructure for Alonissos

Executive Summary

The deliverable presents the technical interventions and infrastructure designed and implemented in the Municipality of Alonissos, aimed at enhancing sustainable waste management within an integrated approach and with an emphasis on the principles of circular economy. It describes the implementation of actions such as Source Separation (SS) of recyclable materials in catering establishments and the implementation of SS of recyclable materials and further streams found on beaches, such as cigarette butts, aiming at the transition of beaches to "zero waste beaches".

Finally, emphasis is placed on the management and utilization of biowaste from catering businesses, through the application of SS and mechanical composting. It also describes the procurement of equipment for separate collection and temporary storage of the collected waste streams and the budget for the implementation of each action.

The report serves as a guide for implementing similar initiatives in other island or mountainous areas of Greece, reinforcing the principles of circular economy and promoting the efficient management of resources.
